1. Safety Considerations

Read these **SAFETY CONSIDERATIONS** carefully before performing any repair work. Comply with these safety symbols without fail.Meanings of **DANGER**, **WARNING**, **CAUTION**, and **NOTE** Symbols:

/! DANGER Indicates an imminently hazardous situation which, if not avoided, will result in death or serious injury.

WARNING Indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.

CAUTION Indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury. It may also be used to alert against unsafe practices.

NOTE Indicates situations that may result in equipment or property-damage accidents only.

1.1 Safety Considerations for Repair

- If refrigerant gas leaks during repair or service, ventilate the area immediately. Refrigerant gas may produce toxic gas if
 it comes into contact with flames. Refrigerant gas is heavier than air and replaces oxygen. In the event of an accident, a
 massive leak could lead to oxygen depletion, especially in basements, and an asphyxiation hazard could occur leading
 to serious injury or death.
- Do not start or stop the air conditioner operation by plugging or unplugging the power cable plug if a plug is used. Plugging or unplugging the power cable plug to operate the equipment may cause an electrical shock or fire.
- Use parts listed in the service parts list and appropriate tools to conduct repair work. The use of inappropriate parts or tools may cause an electrical shock or fire.
- Disconnect power before disassembling the equipment for repairs. Working on the equipment that is connected to the power supply may cause an electric shock. If it is necessary to supply power to the equipment to conduct repairs or to inspect the circuits, do not touch any electrically charged sections of the equipment.
- The step-up capacitor supplies high-voltage electricity to the electrical components of the outdoor unit. Discharge the capacitor completely before conducting repair work. A charged capacitor may cause an electrical shock.
- If refrigerant gas is discharged during repair work, do not touch the discharged refrigerant gas. The refrigerant gas may cause frostbite.
- Use only pipes, flare nuts, tools, and other materials designed specifically for R410A refrigerant systems. Never use tools or materials designed for R22 refrigerant systems on an R410A refrigerant system. Doing so can cause a serious accident or an equipment failure.
- Check to see if the parts and wires are mounted and connected properly, and if the connections at the soldered or crimped terminals are secure. Improper installation and connections may cause excessive heat generation, fire, or electrical shock.
- Prior to disconnecting the suction or discharge pipe from the compressor at the welded section, pump-down the
 refrigerant gas completely in a well-ventilated place first. If there is refrigerant gas or oil remaining inside the
 compressor, the refrigerant gas or oil can discharge when the pipe is being disconnected and it may cause an injury.
- Wear a safety helmet, gloves, and a safety belt when working at an elevated height of more than 6.5 ft (2 m). Insufficient safety measures may cause a fall resulting in injury.
- Do not mix air or gas other than the specified refrigerant R410A to the refrigerant system. If air enters the refrigerant systems, it can cause an excessive high pressure resulting in equipment damage and injury.
- When relocating the equipment, check if the new installation site has sufficient strength to withstand the weight of the equipment. If the installation site does not have sufficient strength and the equipment is not properly secured, the equipment may fall and cause injury.
- Securely fasten the outside unit terminal cover (panel). If the terminal cover/panel is not fastened properly, dust or water may enter the outside unit causing fire or electric shock.
- When relocating the system, keep the refrigerant circuit free from substances other than the specified refrigerant (R-410A) such as air. Any presence of air or other foreign substance in the refrigerant circuit can cause an abnormal pressure rise or rupture, resulting in injury.
- If refrigerant gas leaks, locate the leaking point and repair it before charging refrigerant. After charging refrigerant, check for refrigerant leaks. If the leaking point cannot be located and the repair work must be stopped, perform a pump-down and close the service valve to prevent the refrigerant gas from leaking into the room. The refrigerant gas itself is harmless, but it may generate toxic gases if it comes into contact with flames.

- Do not repair the electrical components with wet hands. Working on the equipment with wet hands may cause an electrical shock.
- Do not clean the air conditioner by splashing water on it. Washing the unit with water may cause an electrical shock.
- Ground the unit when repairing equipment in a humid or wet place to avoid electrical shocks.
- Turn off the power when cleaning the equipment to prevent internal fans that rotate at high speed from starting suddenly as they can cause injury.
- Let the refrigerant lines cool down before performing any repair work. Working on the unit when the refrigerant lines are hot may cause burns.
- All welding and cutting operations must be done in a well-ventilated place to prevent the accumulation of toxic fumes or possibly oxygen deficiency to occur.
- Check the grounding and repair it if the equipment is not properly grounded. Improper grounding may cause an electrical shock.
- Measure the insulation resistance after the repair. The resistance must be 1M Ω or higher. Faulty insulation may cause an electrical shock.
- Check the drainage of the indoor unit after finishing repair work. Faulty drainage may cause water to enter the room resulting in wet floors and furniture.
- Do not tilt the unit when removing it. The water inside the unit may spill resulting in wet floors and furniture.
- Dismantling of the unit, disposal of the refrigerant, oil, and additional parts, should be done in accordance with the relevant local, state, and national regulations.

1.2 Safety Considerations for Users

- Never attempt to modify the equipment. Doing so can cause electrical shock, excessive heat generation, or fire.
- If the power cable and lead wires have scratches or have become deteriorated, have them replaced. Damaged cable and wires may cause an electrical shock or fire.
- Do not use a joined power cable or an extension cord, or share the same power outlet with other electrical appliances as it may cause an electrical shock or fire.
- Use an exclusive power circuit for the equipment. Insufficient circuit amperage capacity may cause an electrical shock or fire.
- Do not damage or modify the power cable. Damaged or modified power cables may cause an electrical shock or fire. Placing heavy items on the power cable or pulling the power cable may damage the cable.
- Check the unit foundation for damage on a continual basis, especially if it has been in use for a long time. If left in a damaged condition, the unit may fall and cause injury. If the installation platform or frame has corroded, have it replaced. A corroded platform or frame may cause the unit to fall resulting in injury.
- If the unit has a power cable plug and it is dirty, clean the plug before securely inserting it into a power outlet. If the plug has a loose connection, tighten it or it may cause electrical shock or fire.
- After replacing the battery in the remote controller, dispose of the old battery to prevent children from swallowing it. If a child swallows the battery, see a doctor immediately.
- Never remove the fan guard of the unit. A fan rotating at high speed without the fan guard is very dangerous.
- Before cleaning the unit, stop the operation of the unit by turning the power off or by pulling the power cable plug out from its receptacle. Otherwise an electrical shock or injury may result.
- Do not wipe the controller operation panel with benzene, thinner, chemical dust cloth, etc. The panel may get discolored or the coating can peel off. If it is extremely dirty, soak a cloth in a water-diluted neutral detergent, squeeze it well, and wipe the panel clean. Then wipe it with another dry cloth.

Main Functions Temperature Control

Definitions of Temperatures

The definitions of temperatures are classified as following.

- Room temperature: temperature of lower part of the room
- Set temperature: temperature set by remote controller
- Room thermistor temperature: temperature detected by room temperature thermistor
- Target temperature: temperature determined by microcomputer

★ The illustration is for FTXS series as representative.

Temperature Control

Parameters

The temperature of the room is detected by the room temperature thermistor. However, there is difference between the "temperature detected by room temperature thermistor" and the "temperature of lower part of the room", depending on the type of the indoor unit or installation condition. Practically, the temperature control is done by the "target temperature appropriately adjusted for the indoor unit" and the "temperature detected by room temperature thermistor".

1.2 Frequency Principle

 Main Control
 The compressor is frequency-controlled during normal operation. The target frequency is set by the following 2 parameters coming from the operating indoor unit:

 The load condition of the operating indoor unit
 The load condition of the operating indoor unit

 The difference between the room thermistor temperature and the target temperature

 Additional
 The target frequency is adapted by additional parameters in the following cases:

 Frequency restrictions
 Frequency restrictions

- Initial settings
- Forced cooling operation

Inverter Principle

To regulate the capacity, a frequency control is needed. The inverter makes it possible to alter the rotation speed of the compressor. The following table explains the conversion principle:

olulion op						
Phase	Description					
1	The supplied AC power source is converted into the DC power source for the present.					
	 The DC power source is reconverted into the three phase AC power source with variable frequency. When the frequency increases, the rotation speed of the compressor increases resulting in an increased refrigerant circulation. This leads to a higher amount of the heat exchange per unit. When the frequency decreases, the rotation speed of the compressor decreases resulting in a decreased refrigerant circulation. This leads to a lower amount of the heat exchange per unit. 					

Drawing of Inverter

The following drawing shows a schematic view of the inverter principle:

Inverter Features

The inverter provides the following features:

- The regulating capacity can be changed according to the changes in the outdoor temperature and cooling / heating load.
- Quick heating and quick cooling The compressor rotational speed is increased when starting the heating (or cooling). This enables to reach the set temperature quickly.
- Even during extreme cold weather, high capacity is achieved. It is maintained even when the outdoor temperature is 2°C (35.6°F).
- Comfortable air conditioning
 A fine adjustment is integrated to keep the room temperature constant.
- Energy saving heating and cooling Once the set temperature is reached, the energy saving operation enables to maintain the room temperature at low power.

Frequency Limits

Frequency	Functions
_ow	Four-way valve operation compensation. Refer to page 45.
High	 Compressor protection function. Refer to page 46. Discharge pipe temperature control. Refer to page 46. Input current control. Refer to page 47. Freeze-up protection control. Refer to page 48. Heating peak-cut control. Refer to page 48. Defrost control. Refer to page 50.

Forced CoolingRefer to page 384 for detail.Operation

1.3 Airflow Direction Control (FTXS Series)

Power-Airflow Dual Louvers The large louver sends a large volume of air downward to the floor and provides an optimum control in cooling, dry, and heating operation.

<Cooling / Dry>

During cooling or dry operation, the louver retracts into the indoor unit. Then, cool air can be blown far and distributed all over the room.

<Heating>

During heating operation, the large louver directs airflow downward to spread the warm air to the entire room.

Wide-Angle Fins The fins, made of elastic synthetic resin, provide a wide range of airflow that guarantees comfortable air distribution.

Auto-Swing

The following table explains the auto swing process for cooling, dry, heating, and fan:

	Vert	Horizontal Swing		
	Cooling / Dry	Heating Fan		(right and left)
09/12 class	15° 35° 45° (R13527)	30° 30° 4 70° 65° (R11402)	5°,°, °, °, °, °, °, °, °, °, °, °, °, °, °	(R11404)
15/18/24/30/36 class	15°°°°°°°°°°°°°°°°°°°°°°°°°°°°°°°°°°°°	30°, 40° 75° 70° (R9304)	15° /25° 70° (R9305)	(R9306)

COMFORT

AIRFLOW Operation

3-D Airflow Alternative repetition of vertical and horizontal swing motions enables uniform airconditioning of the entire room. This function is effective for starting the air conditioner.

When the horizontal swing and vertical swing are both set to automatic operation, the airflow becomes 3-D airflow. The horizontal and vertical swing motion is altered and the airflow direction changes in the order shown in the following diagram.

- (1) The vertical blades (fins) move from the right to the left.
- (2) The horizontal blades (louvers) move downward.
- (3) The vertical blades (fins) move from the left to the right.
- (4) The horizontal blades (louvers) move upward.

The horizontal blades (louvers) are controlled not to blow the air directly at the people in the room.

	Cooling	Heating
09/12 class	8° 0 0 (R4302)	80° (R8413)
15/18/24/30/36 class	10°	0 0 0 75° 80°
	(R9655)	(R9654)

Function and Control

1.4 Fan Speed Control for Indoor Unit

Outline

Phase control and fan speed control contains 9 steps: LLL, LL, SL, L, ML, M, MH, H, and HH. The airflow rate can be automatically controlled depending on the difference between the room thermistor temperature and the target temperature. This is done through phase control and Hall IC control.

For more information about Hall IC, refer to the troubleshooting for fan motor on page 99.

Automatic Fan Speed Control In automatic fan speed operation, the step "SL" is not available.

= The airflow rate is automatically controlled within this range when the FAN setting button is set to <u>automatic</u>.

<Cooling>

The following drawing explains the principle of fan speed control for cooling.

*For FTXS series, the upper limit is M tap in 30 minutes from the operation start.

<Heating>

In heating operation, the fan speed is regulated according to the indoor heat exchanger temperature and the difference between the room thermistor temperature and the target temperature.

- 1. During POWERFUL operation, the fan rotates at H tap + 50 rpm.
 - 2. The fan stops during defrost operation.

COMFORT AIRFLOW Operation

FTXS series

The fan speed is controlled automatically within the following steps.
 <Cooling>

 L tap ~ MH tap (same as AUTOMATIC)
 <Heating>
 ML tap ~ MH tap

■ The latest command has the priority between POWERFUL and COMFORT AIRFLOW.

1.5 Program Dry Operation

Outline

Program dry operation removes humidity while preventing the room temperature from lowering. Since the microcomputer controls both the temperature and airflow rate, the temperature adjustment and [FAN] setting buttons are inoperable.

Detail

The microcomputer automatically sets the temperature and airflow rate. The difference between the room thermistor temperature at start-up and the target temperature is divided into two zones. Then, the unit operates in an appropriate capacity for each zone to maintain the temperature and humidity at a comfortable level.

Room thermistor temperature at start-up			Thermostat ON point Z
24°C (75.2°F) or more	Room thermistor	X – 2.5°C (–4.5°F)	X – 0.5°C (– 0.9°F) or Y + 0.5°C (0.9°F) (zone B) continues for 10 min.
23.5°C (74.3°F) , 18°C (64.4°F)	temperature at start-up	X – 2.0°C (–3.6°F)	X – 0.5°C (– 0.9°F) or Y + 0.5°C (0.9°F) (zone B) continues for 10 min.
17.5°C (63.5°F) ،	17.5°C (63.5°F) 18°C (64.4°F)		X -0.5°C (-0.9°F) = 17.5°C (63.5°F) or Y + 0.5°C (0.9°F) (zone B) continues for 10 min.

(R11587)

1.6 Automatic Operation

Outline	Automatic Cooling / Heating Function When the automatic operation is selected with the remote controller, the microcomputer automatically determines the operation mode as cooling or heating according to the room temperature and the set temperature at start-up. The unit automatically switches the operation mode to maintain the room temperature at the set temperature.
Detail	
	Target temperature $-2.0^{\circ}C(-3.6^{\circ}F)$ = Thermostat OFF Target temperature $-2.5^{\circ}C(-4.5^{\circ}F)$ Heating Operation (R16965) Ex: When the target temperature is 25°C (77°F) Cooling $\rightarrow 23^{\circ}C(73.4^{\circ}F)$: Thermostat OFF $\rightarrow 22^{\circ}C(71.6^{\circ}F)$: Switch to heating Heating $\rightarrow 27^{\circ}C(80.6^{\circ}F)$: Thermostat OFF $\rightarrow 28^{\circ}C(82.4^{\circ}F)$: Switch to cooling
	FDXS series
	FDXS seriesTarget temperature - 2.0°C (-3.6°F)Target temperature - 2.0°C (-3.6°F)= Thermostat OFF= Thermostat OFFTarget temperature - 2.5°C (-4.5°F)Heating Operation(R16966)Ex: When the target temperature is 25°C (77°F)Cooling \rightarrow 23°C (73.4°F): Thermostat OFF \rightarrow 22°C (71.6°F): Switch to heating Heating \rightarrow 26.5°C (79.7°F): Thermostat OFF \rightarrow 27.5°C (81.5°F): Switch to cooling

1.7 **Thermostat Control**

Thermostat control is based on the difference between the room thermistor temperature and the target temperature.

Thermostat OFF Condition

The temperature difference is in the zone A. ٠

Thermostat ON Condition

- The temperature difference returns to the zone C after being in the zone A.
- The system resumes from defrost control in any zones except A.
- The operation turns on in any zones except A.
- The monitoring time has passed while the temperature difference is in the zone B. (Cooling / Dry: 10 minutes, Heating: 10 seconds)

<Cooling / Dry>

FTXS series

(R14452)

FDXS series

<Heating>

(R14451)

Refer to "Temperature Control" on page 28 for detail.

1.8 NIGHT SET Mode

Outline

When the OFF timer is set, the NIGHT SET Mode is automatically activated. The NIGHT SET Mode keeps the airflow rate setting.

Detail

The NIGHT SET Mode continues operation at the target temperature for the first one hour, then automatically raises the target temperature slightly in the case of cooling, or lowers it slightly in the case of heating. This prevents excessive cooling in summer and excessive heating in winter to ensure comfortable sleeping conditions, and also conserves electricity.

<Cooling>

(R14453)

<Heating>

1.9 ECONO Operation

Outline

ECONO operation reduces the maximum operating current and the power consumption. This operation is particularly convenient for energy-saving-oriented users. It is also a major bonus for those whose breaker capacities do not allow the use of multiple electrical devices and air conditioners.

It is easily activated from the wireless remote controller by pushing the [ECONO] button.

- When this function is activated, the maximum capacity also decreases.
- The remote controller can send the ECONO command when the unit is in COOL, HEAT, DRY, or AUTO operation. This function can only be set when the unit is running. Pressing the [ON/OFF] button on the remote controller cancels the function.
- This function and POWERFUL operation cannot be used at the same time. The latest command has the priority.

1.10 INTELLIGENT EYE Operation (FTXS Series)

Outline

This function detects the existence of humans in the room with a motion sensor (INTELLIGENT EYE) and reduces the capacity when there is nobody in the room in order to save electricity.

Detail

1. Detection method by INTELLIGENT EYE

- This sensor detects human motion by receiving infrared rays and displays the pulse wave output.
- The microcomputer in the indoor unit carries out a sampling every 20 msec. and if it detects 10 cycles of the wave in 1 second in total (corresponding to 20 msec. x 10 = 200 msec.), it judges humans are in the room as the motion signal is ON.

2. The motions (for example: in cooling)

- When the microcomputer does not have a signal from the sensor in 20 minutes, it judges that nobody is in the room and operates the unit at a temperature shifted from the target temperature. (Cooling / Dry: 1 ~ 2°C (1.8 ~ 3.6°F) higher, Heating: 2°C (3.6°F) lower, Auto: according to the operation mode at that time.)
- \star In FAN operation, the fan speed is reduced by 60 rpm.

Others

For dry operation, you cannot set the temperature with a remote controller, but the target temperature is shifted internally.

1.11 Inverter POWERFUL Operation

Outline

In order to exploit the cooling and heating capacity to full extent, operate the air conditioner by increasing the indoor fan rotating speed and the compressor frequency.

Detail

When [POWERFUL] button is pressed, the fan speed and target temperature are converted to the following states for 20 minutes.

Operation mode	Fan speed	Target temperature
COOL	H tap + A rpm	18°C (64.4°F)
DRY	Dry rotating speed + A rpm	Lowered by 2.5°C (4.5°F)
HEAT	H tap + A rpm 30 ~ 31.5°C (86 ~	
FAN	H tap + A rpm	—
AUTO	Same as cooling / heating in POWERFUL operation	The target temperature is kept unchanged.

A = 50 rpm

Ex: POWERFUL operation in cooling

1.12 Other Functions

1.12.1 Hot-Start Function

In order to prevent the cold air blast that normally comes when heating operation is started, the temperature of the indoor heat exchanger is detected, and the airflow is either stopped or made very weak thereby carrying out comfortable heating of the room.

*The cold air blast is also prevented using similar control when the defrosting operation is started or when the thermostat is turned ON.

1.12.2 Signal Receiving Sign

When the indoor unit receives a signal from the remote controller, the unit emits a signal receiving sound.

1.12.3 Indoor Unit ON/OFF Button

An [ON/OFF] button is provided on the display of the unit.

- Press the [ON/OFF] button once to start operation. Press once again to stop it.
- The [ON/OFF] button is useful when the remote controller is missing or the battery has run out.
- The operation mode refers to the following table.

	Operation mode	Temperature setting	Airflow rate
Cooling Only	COOL	22°C (71.6°F)	Automatic
Heat Pump	AUTO	25°C (77°F)	Automatic

Ex: FTXS series

<Forced cooling operation>

Forced cooling operation can be started by pressing the [ON/OFF] button for 5 to 9 seconds while the unit is not operating.

Refer to page 384 for detail.

When the [ON/OFF] button is pressed for 10 seconds or more, the forced cooling operation is stopped.

1.12.4 Titanium Apatite Photocatalytic Air-Purifying Filter

This filter combines the Air-Purifying Filter and Titanium Apatite Photocatalytic Deodorizing Filter as a single highly effective filter. The filter traps microscopic particles, decomposes odors and even deactivates bacteria and viruses. It lasts for 3 years without replacement if washed about once every 6 months.

1.12.5 Auto-restart Function

If a power failure (including one for just a moment) occurs during the operation, the operation restarts automatically when the power is restored in the same condition as before the power failure.

: It takes 3 minutes to restart the operation because the 3-minute standby function is activated.

1.12.6 WEEKLY TIMER Operation

Up to 4 timer settings can be saved for each day of the week (up to 28 settings in total). Those 3 items of "ON/OFF", "temperature" and "time" can be set.

Refer to page 71 for detail.

2. Function of Thermistor

(1) Outdoor Heat Exchanger Thermistor	 The outdoor heat exchanger thermistor is used for controlling the target discharge pipe temperature. The system sets the target discharge pipe temperature according to the outdoor and indoor heat exchanger temperature, and controls the electronic expansion valve opening so that the target discharge pipe temperature can be obtained. In cooling operation, the outdoor heat exchanger thermistor is used for detecting the disconnection of the discharge pipe thermistor. When the discharge pipe temperature becomes lower than the outdoor heat exchanger temperature, the discharge pipe thermistor is judged as disconnected. In cooling operation, the outdoor heat exchanger thermistor is used for high pressure protection.
(2) Discharge Pipe Thermistor	 The discharge pipe thermistor is used for controlling discharge pipe temperature. If the discharge pipe temperature (used in place of the inner temperature of the compressor) rises abnormally, the operating frequency becomes lower or the operation halts. The discharge pipe thermistor is used for detecting disconnection of the discharge pipe thermistor.
(3) Indoor Heat Exchanger Thermistor	 The indoor heat exchanger thermistor is used for controlling the target discharge pipe temperature. The system sets the target discharge pipe temperature according to the outdoor and indoor heat exchanger temperature, and controls the electronic expansion valve opening so that the target discharge pipe temperature can be obtained. In cooling operation, the indoor heat exchanger thermistor is used for freeze-up protection control. If the indoor heat exchanger temperature drops abnormally, the operating frequency becomes lower or the operation halts. In heating operation, the indoor heat exchanger thermistor is used for detecting the disconnection of the discharge pipe thermistor. When the discharge pipe temperature becomes lower than the indoor heat exchanger temperature, the discharge pipe thermistor is judged as disconnected.

3. Control Specification3.1 Mode Hierarchy

Outline

There are 3 modes; normal operation mode, forced operation mode and the power transistor test mode for installation and servicing.

Detail

Cooling Only Model

(R14428)

e: Unless specified otherwise, an indoor dry operation command is regarded as cooling operation.

3.2 Frequency Control

Outline

Frequency is determined according to the difference between the room thermistor temperature and the target temperature.

The function is explained as follows.

- 1. How to determine frequency
- 2. Frequency command from the indoor unit (Difference between the room thermistor temperature and the target temperature)
- 3. Frequency initial setting
- 4. PI control

When the shift of the frequency is less than zero (Δ F<0) by PI control, the target frequency is used as the command frequency.

Detail

How to Determine Frequency

The compressor's frequency is determined by taking the following steps.

For Cooling Only Model

1. Determine command frequency

- Command frequency is determined in the following order of priority.
 - 1. Forced cooling
 - 2. Indoor frequency command

2. Determine upper limit frequency

 The minimum value is set as an upper limit frequency among the frequency upper limits of the following functions:

Compressor protection, input current, discharge pipe temperature, freeze-up protection.

3. Determine lower limit frequency

 The maximum value is set as a lower limit frequency among the frequency lower limits of the following function:

Pressure difference upkeep.

4. Determine prohibited frequency

• There is a certain prohibited frequency such as a power supply frequency.

For Heat Pump Model

1. Determine command frequency

- Command frequency is determined in the following order of priority.
 - 1. Limiting defrost control time
 - 2. Forced cooling
 - 3. Indoor frequency command

2. Determine upper limit frequency

• The minimum value is set as an upper limit frequency among the frequency upper limits of the following functions:

Compressor protection, input current, discharge pipe temperature, heating peak-cut, freeze-up protection, defrost.

3. Determine lower limit frequency

 The maximum value is set as a lower limit frequency among the frequency lower limits of the following functions:

Four-way valve operation compensation, draft prevention, pressure difference upkeep.

4. Determine prohibited frequency

• There is a certain prohibited frequency such as a power supply frequency.

Indoor Frequency Command (AD signal)

The difference between the room thermistor temperature and the target temperature is taken as the " ΔD signal" and is used for frequency command.

	Temperature difference	∆D signal	Temperature difference	∆D signal	Temperature difference	∆D signal	Temperature difference	∆D signal
	–2.0°C (–3.6°F)	*Th OFF	0°C (0°F)	4	2.0°C (3.6°F)	8	4.0°C (7.2°F)	С
ĺ	–1.5°C (–2.7°F)	1	0.5°C (0.9°F)	5	2.5°C (4.5°F)	9	4.5°C (8.1°F)	D
	-1.0°C (-1.8°F)	2	1.0°C (1.8°F)	6	3.0°C (5.4°F)	А	5.0°C (9°F)	E
	–0.5°C (–0.9°F)	3	1.5°C (2.7°F)	7	3.5°C (6.3°F)	В	5.5°C (9.9°F)	F

*Th OFF = Thermostat OFF

Frequency Initial Setting

<Outline>

When starting the compressor, the frequency is initialized according to the ΔD value and the Q value of the indoor unit.

Q value: Indoor unit output determined from indoor unit volume, airflow rate and other factors.

PI Control (Determine Frequency Up / Down by ΔD Signal)

1. P control

The ΔD value is calculated in each sampling time (15 ~ 20 seconds), and the frequency is adjusted according to its difference from the frequency previously calculated.

2. I control

If the operating frequency does not change for more than a certain fixed time, the frequency is adjusted according to the ΔD value.

When the ΔD value is low, the frequency is lowered.

When the ΔD value is high, the frequency is increased.

3. Frequency management when other controls are functioning

- When frequency is dropping;
 Frequency management is carried out only when the frequency drops.
- For limiting lower limit Frequency management is carried out only when the frequency rises.

4. Upper and lower limit of frequency by PI control

The frequency upper and lower limits are set according to the command of the indoor unit. When the indoor or outdoor unit quiet operation command comes from the indoor unit, the upper limit frequency is lower than the usual setting.

3.3 Controls at Mode Changing / Start-up

3.3.1 Preheating Operation

Outline

The inverter operation in open phase starts with the conditions of the preheating command from the indoor unit, the outdoor temperature, and the discharge pipe temperature.

Detail

ON Condition

• When the discharge pipe temperature is below **A**, the inverter operation in open phase starts. **OFF Condition**

• When the discharge pipe temperature is higher than **B**, the inverter operation in open phase stops.

	Α	В
09/12 class	0°C (32°F)	12°C (53.6°F)
15/18/24/30/36 class	0°C (32°F)	8°C (46.4°F)

3.3.2 Four-Way Valve Switching

Outline

In heating operation, current is conducted, and in cooling and defrosting operation, current is not conducted. In order to eliminate the switching sound as the four-way valve coil switches from ON to OFF when the heating is stopped, the OFF delay switch of the four-way valve is carried out.

Detail

OFF delay switch of four-way valve:

The four-way valve coil is energized for 150 ~ 160 seconds after the operation is stopped.

3.3.3 Four-Way Valve Operation Compensation

Outline At the beginning of the operation as the four-way valve is switched, the pressure difference to activate the four-way valve is acquired by having output frequency which is more than a certain fixed frequency, for a certain fixed time.

Detail

Starting Conditions

- 1. When starting the compressor for heating
- 2. When the operation mode changes from heating to cooling
- 3. When starting the compressor for defrosting
- 4. When starting the compressor for heating after defrosting
- 5. When starting the compressor for the first time after resetting with the power ON
- 6. When starting the compressor after the fault of switching over cooling / heating
- The lower limit of frequency keeps A Hz for B seconds with any conditions 1 through 6 above.

	09/12 class		15/18 class		24 class		30/36 class		
	Cooling	Heating	Cooling	Heating	Cooling	Heating	Cooling	Heating	
A (Hz)	68	66	48		28		83		
B (seconds)	4	5	70		70 7		0	7	0

3.3.4 3-minute Standby

Turning on the compressor is prohibited for 3 minutes after turning it off. (Except when defrosting.)

3.3.5 Compressor Protection Function

When turning the compressor from OFF to ON, the upper limit of frequency is set as follows. (The function is not activated when defrosting.)

	09/12 class	15/18 class	24 class	30/36 class
A (Hz)	48	55	55	46 ~ 55
B (Hz)	64	70	65	65
C (Hz)	88	85	80	80
D (seconds)	240	120	120	120 ~ 500
E (seconds)	360	200	200	100 ~ 200
F (seconds)	180	470	470	470

3.4 Discharge Pipe Temperature Control

Outline

The discharge pipe temperature is used as the internal temperature of the compressor. If the discharge pipe temperature rises above a certain level, the upper limit of frequency is set to keep the discharge pipe temperature from rising further.

Detail

Zone	Control
Stop zone	When the temperature reaches the stop zone, the compressor stops.
Dropping zone	The upper limit of frequency decreases.
Keep zone	The upper limit of frequency is kept.
Up zone	The upper limit of frequency increases.
Reset zone	The upper limit of frequency is canceled.

	09/12 class	15/18 class	24/30/36 class
Α	110°C (230°F)	110°C (230°F)	120°C (248°F)
В	105°C (221°F)	103°C (217.4°F)	111°C (231.8°F)
С	101°C (213.8°F)	101.5°C (214.7°F)	109°C (228.2°F)
D	99°C (210.2°F)	100°C (212°F)	107°C (224.6°F)
Е	97°C (206.6°F)	95°C (203°F)	107°C (224.6°F)

3.5 Input Current Control

Outline

The microcomputer calculates the input current while the compressor is running, and sets the frequency upper limit from the input current.

In case of heat pump models, this control which is the upper limit control of the frequency takes priority over the lower limit of control of four-way valve operation compensation.

Detail

Frequency control in each zone Stop zone

• After 2.5 seconds in this zone, the compressor is stopped.

Dropping zone

- The upper limit of the compressor frequency is defined as operation frequency 2 Hz.
- After this, the output frequency is lowered by 2 Hz every second until it reaches the keep zone. **Keep zone**
- The present maximum frequency goes on.

Reset zone

• Limit of the frequency is canceled.

	09 class		12 c	lass	15/18 class

B (A)	15.0	17.0	19.0				
C (A)	14.0	16.0	18	3.0			

Limitation of current dropping and stop value according to the outdoor temperature

 The current drops when outdoor temperature becomes higher than a certain level (depending on the model).

3.6 Freeze-up Protection Control

Outline

During cooling operation, the signal sent from the indoor unit controls the operating frequency limitation and prevents freezing of the indoor heat exchanger. (The signal from the indoor unit is divided into zones.)

Detail

3.7 Heating Peak-cut Control

Outline

During heating operation, the indoor heat exchanger temperature determines the frequency upper limit to prevent abnormal high pressure.

Detail

Zone	Control
Stop zone	When the temperature reaches the stop zone, the compressor stops.
Dropping zone	The upper limit of frequency decreases.
Keep zone	The upper limit of frequency is kept.
Up zone	The upper limit of frequency increases.
Reset zone	The upper limit of frequency is canceled.

3.8 Outdoor Fan Control

1. Fan ON control to cool down the electrical box

The outdoor fan is turned ON when the electrical box temperature is high while the compressor is OFF.

2. Fan OFF control during defrosting

The outdoor fan is turned OFF during defrosting.

3. Fan OFF delay when stopped

The outdoor fan is turned OFF 60 seconds after the compressor stops.

4. Fan speed control for pressure difference upkeep

The rotation speed of the outdoor fan is controlled for keeping the pressure difference during cooling operation with low outdoor temperature.

- When the pressure difference is low, the rotation speed of the outdoor fan is reduced.
- When the pressure difference is high, the rotation speed of the outdoor fan is controlled as well as normal operation.

5. Fan speed control during forced cooling operation

The outdoor fan is controlled as well as normal operation during forced cooling operation.

6. Fan speed control during POWERFUL operation

The rotation speed of the outdoor fan is increased during POWERFUL operation.

7. Fan speed control during indoor / outdoor unit quiet operation

The rotation speed of the outdoor fan is reduced by the command of the indoor / outdoor unit quiet operation.

8. Fan ON/OFF control when operation starts / stops

The outdoor fan is turned ON when the operation starts. The outdoor fan is turned OFF when the operation stops.

3.9 Liquid Compression Protection Function

Outline

In order to obtain the dependability of the compressor, the compressor is stopped according to the outdoor temperature and temperature of the outdoor heat exchanger.

Detail

Operation stops depending on the outdoor temperature.
 Compressor turns off under the conditions that the system is in cooling operation and outdoor temperature is below 0°C (32°F).

3.10 Defrost Control

Outline

Defrosting is carried out by the cooling cycle (reverse cycle). The defrosting time or outdoor heat exchanger temperature must be more than a certain value to finish.

Detail

Conditions for Starting Defrost

- The starting conditions are determined with the outdoor temperature and the outdoor heat exchanger temperature.
- The system is in heating operation.
- The compressor operates for 6 minutes.
- More than A minutes (depending on the duration of the previous defrost control) of accumulated time have passed since the start of the operation, or ending the previous defrosting.

Conditions for Canceling Defrost

The judgment is made with the outdoor heat exchanger temperature L.

	09/12 class	15/18 class	24 class	30/36 class
A (minutes)	15 ~ 28	15 ~ 44	15 ~ 38	15 ~ 38

3.11 Electronic Expansion Valve Control

Outline

The following items are included in the electronic expansion valve control. **Electronic expansion valve is fully closed**

- 1. Electronic expansion valve is fully closed when turning on the power.
- 2. Pressure equalizing control

Open Control

- 1. Electronic expansion valve control when starting operation
- 2. Electronic expansion valve control when the frequency changes
- 3. Electronic expansion valve control for defrosting
- 4. Electronic expansion valve control when the discharge pipe temperature is abnormally high
- 5. Electronic expansion valve control when the discharge pipe thermistor is disconnected **Feedback Control**
- 1. Target discharge pipe temperature control

Detail

The followings are the examples of electronic expansion valve control which function in each operation mode.

■ : Holding Functions — : No Functions Cooling	When the power turns on or when the compressor stops	When the operation starts	When the frequency changes under starting control	During target discharge pipe temperature control	When the frequency changes under target discharge pipe temperature control	When the disconnection of the discharge pipe thermistor is ascertained	When the frequency changes under the control for disconnection of the discharge pipe thermistor	Under defrost control

3.11.1 Fully Closing with Power ON

The electronic expansion valve is initialized when turning on the power. The opening position is set and the pressure equalization is developed.

3.11.2 Pressure Equalizing Control

When the compressor is stopped, the pressure equalization control is activated. The electronic expansion valve opens, and develops the pressure equalization.

3.11.3 Opening Limit Control

Outline

A maximum and minimum opening of the electronic expansion valve are limited.

Detail

	09/12 class	15/18 class	24 class	30/36 class
Maximum opening (pulse)	480	480	450	480
Minimum opening (pulse)	52	54	75	10

The electronic expansion valve is fully closed when cooling operation stops, and is opened at a fixed degree during defrosting.

3.11.4 Starting Operation Control

The electronic expansion valve opening is controlled when the operation starts, and prevents superheating or liquid compression.

3.11.5 Control when the Frequency Changes

When the target discharge pipe temperature control is active, if the target frequency is changed to a specified value in a certain time period, the target discharge pipe temperature control is canceled and the target opening of the electronic expansion value is changed according to the shift.

3.11.6 High Discharge Pipe Temperature Control

When the compressor is operating, if the discharge pipe temperature exceeds a certain value, the electronic expansion valve opens and the refrigerant runs to the low pressure side. This procedure lowers the discharge pipe temperature.

3.11.7 Control for Disconnection of the Discharge Pipe Thermistor

Outline	temperature with the electronic ex frequency, opera After 3 minutes, If the discharge time. 	C (seconds)	810	540	540	

Adjustment when the thermistor is disconnected

When the disconnection is ascertained, the compressor continues operation for 9 minutes and then stops.

If the compressor stops repeatedly, the system is shut down.

3.11.8 Target Discharge Pipe Temperature Control

The target discharge pipe temperature is obtained from the indoor and outdoor heat exchanger temperature, and the electronic expansion valve opening is adjusted so that the actual discharge pipe temperature becomes close to the target discharge pipe temperature. (Indirect SH (superheating) control using the discharge pipe temperature)

The electronic expansion valve opening and the target discharge pipe temperature are adjusted every 20 seconds. The target discharge pipe temperature is controlled by indoor heat exchanger temperature and outdoor heat exchanger temperature. The opening degree of the electronic expansion valve is controlled by the followings.

- Target discharge pipe temperature
- Actual discharge pipe temperature
- Previous discharge pipe temperature

3.12 Malfunctions

3.12.1 Sensor Malfunction Detection

Sensor malfunction may occur in the thermistor.

Relating to Thermistor Malfunction

- 1. Outdoor heat exchanger thermistor
- 2. Discharge pipe thermistor
- 3. Radiation fin thermistor
- 4. Outdoor temperature thermistor

3.12.2 Detection of Overcurrent and Overload

Outline

An excessive output current is detected and the OL temperature is observed to protect the compressor.

Detail

- If the OL (compressor head) temperature exceeds 120 ~ 130°C (248 ~ 266°F), the system shuts down the compressor.
- If the inverter current exceeds 9.25 ~ 20 A (depending on the model), the system shuts down the compressor.

3.12.3 Refrigerant Shortage Control

Outline

I: Detecting by power consumption

If the power consumption is below the specified value and the frequency is higher than the specified frequency, it is regarded as refrigerant shortage.

The power consumption is low comparing with that in the normal operation when refrigerant is insufficient, and refrigerant shortage is detected by checking power consumption.

II: Detecting by discharge pipe temperature

If the discharge pipe temperature is higher than the target discharge pipe temperature, and the electronic expansion valve is fully open for more than the specified time, it is regarded as refrigerant shortage.

III: Detecting by the difference of temperature

If the difference between suction and discharge temperature is smaller than the specified value, it is regarded as refrigerant shortage.

Refer to page 104 for detail.

1. System Configuration

After installation and trial operation of the room air conditioner are completed, the air conditioner should be handled and operated as described in the following pages. Every user should be informed on the correct method of operation and how to check if it can cool (or heat) well, and how to use it efficiently.

Providing instructions to the user can reduce requests for servicing by 80%. However proficient the installation and operating functions of the AC system are, the customer may fault either the room air conditioner or its installation work when it is actually due to improper handling. The installation work and the handing-over of the unit can only be considered completed when its handling has been fully explained to the user without using technical terms, and while imparting full knowledge of the equipment.

2.4 COMFORT AIRFLOW / INTELLIGENT EYE Operation

COMFORT AIRFLOW / INTELLIGENT EYE Operation

COMFORT AIRFLOW operation

The flow of air will be in the upward direction while in COOL operation and in the downward direction while in HEAT operation, providing comfortable temperatures without air blowing directly on people.

■ INTELLIGENT EYE operation

"INTELLIGENT EYE" is the infrared sensor which detects human movement. If no one is in the room for more than 20 minutes, the operation automatically changes to energy saving operation.

INTELLIGENT EYE operation is useful for energy saving

Energy saving operation

- If no presence detected in the room for 20 minutes, the energy saving operation will start.
- This operation changes the temperature –3.6°F (–2°C) in HEAT / +3.6°F (+2°C) in COOL / +3.6°F (+2°C) in DRY operation from set temperature. When the room temperature exceeds 86°F (30°C), the operation changes the temperature +1.8°F (+1°C) in COOL / +1.8°F (+1°C) in DRY operation from set temperature.
- This operation decreases the airflow rate slightly in FAN mode only.

Combination COMFORT AIRFLOW and INTELLIGENT EYE operation

The air conditioner can go into operation with the COMFORT AIRFLOW and INTELLIGENT EYE functions combined.

15

2.5 **POWERFUL Operation**

POWERFUL Operation

2.6 OUTDOOR UNIT QUIET Operation

OUTDOOR UNIT QUIET Operation

2.7 ECONO Operation

ECONO Operation

ECONO operation is a function which enables efficient operation by limiting the maximum power consumption value.

This function is useful for cases in which attention should be paid to ensure a circuit breaker will not trip when the product runs alongside other appliances.

■ To start ECONO operation

Press **FECONO** during operation.

• "" is displayed on the LCD.

To cancel ECONO operation

Press 🔀 again.

• """ is no longer displayed on the LCD.

[Example]

 In case the air conditioner and other appliances which require high power consumption are used at same time, a circuit breaker may trip if the air conditioner operate with its maximum capacity.

Running current and power consumption

- The maximum power consumption of the air conditioner is limited by using ECONO operation. The circuit breaker is unlikely to trip even if the air conditioner and other appliances are used at same time.
- This diagram is a representation for illustrative purposes only. The maximum running current and power consumption of the air conditioner in ECONO.

consumption of the air conditioner in ECONO operation vary with the connecting outdoor unit.

NOTE

- Notes on ECONO operation
 - ECONO operation can only be set when the unit is running. Pressing causes the settings to be canceled, and """ is no longer displayed on the LCD.
 - ECONO operation functions in AUTO, COOL, DRY, and HEAT operation.
- POWERFUL and ECONO operation cannot be used at the same time.
 Priority is given to the function of whichever button is pressed last.
- If the level of power consumption is already low, ECONO operation will not drop the power consumption.

2.8 **OFF TIMER Operation**

Names of Parts

3.2 AUTO · DRY · COOL · HEAT · FAN Operation

AUTO - DRY - COOL - HEAT -* **FAN Operation** MODE The air conditioner operates with the operation mode of your choice. From the next time on, the air conditioner will operate with the same operation mode. ON °8 /' To start operation **1.** Press MODE and select an operation mode. · Each pressing of the button advances the mode setting in sequence. OON/OFF IAI * 2 AUTO DRY COOL HEAT FAN MODE ON/OFF 2. Press • "ON" is displayed on the LCD. • The OPERATION lamp lights green. TO 000 Φ Display To stop operation 心ON/OFF Press again. • "ON" is no longer displayed on the LCD. • The OPERATION lamp goes off. NOTE MODE Notes on each operation mode Since this air conditioner heats the room by taking heat from outdoor air to indoors, the heating capacity becomes smaller in lower outdoor temperatures. If the heating effect is insufficient, it is recommended to use another heating appliance in combination with the air conditioner. • The heat pump system heats the room by circulating hot air around all parts of the room. After the start of HEAT operation, it takes HEAT some time before the room gets warmer. • In HEAT operation, frost may occur on the outdoor unit and lower the heating capacity. In that case, the system switches into defrosting operation to take away the frost. · During defrosting operation, hot air does not flow out of indoor unit. • This air conditioner cools the room by releasing the heat in the room outside. Therefore, the cooling performance of the air 000 conditioner may be degraded if the outdoor temperature is high. • The computer chip works to rid the room of humidity while maintaining the temperature as much as possible. It automatically DRY controls temperature and airflow rate, so manual adjustment of these functions is unavailable. • In AUTO operation, the system selects an appropriate operation mode (COOL or HEAT) based on the room and outside AUTO temperatures and starts the operation. • The system automatically reselects setting at a regular interval to bring the room temperature to user-setting level. FAN . This mode is valid for fan only 11

3.4 **POWERFUL Operation**

POWERFUL Operation

3.5 OUTDOOR UNIT QUIET Operation

OUTDOOR UNIT QUIET Operation

3.6 ECONO Operation

ECONO Operation

ECONO operation is a function which enables efficient operation by limiting the maximum power consumption value.

This function is useful for cases in which attention should be paid to ensure a circuit breaker will not trip when the product runs alongside other appliances.

Troubleshooting with LED Indoor Unit

Operation Lamp

The operation lamp blinks when any of the following errors is detected.

- 1. When a protection device of the indoor or outdoor unit is activated, or when the thermistor malfunctions.
- 2. When a signal transmission error occurs between the indoor and outdoor units.
- In either case, conduct the diagnostic procedure described in the following pages.

FTXS series

(Ex. 09/12 class)

FDXS series

Service Monitor

The indoor unit has one green LED (LED A) on the control PCB. When the microcomputer works in order, the LED A blinks.

1.2 Outdoor Unit

The outdoor unit has one green LED (LED A) on the PCB. When the microcomputer works in order, the LED A blinks.

2. Problem Symptoms and Measures

Symptom	Check Item	Details of Measure	Reference Page
The unit does not operate.	Check the power supply.	Check if the rated voltage is supplied.	_
	Check the type of the indoor unit.	Check if the indoor unit type is compatible with the outdoor unit.	
	Check the outdoor temperature.	Heating operation cannot be used when the outdoor temperature is 24°C (75.2°F) or higher, and cooling operation cannot be used when the outdoor temperature is below 10°C (50°F).	_
	Diagnose with remote controller indication.	—	94
	Check the remote controller addresses.	Check if address settings for the remote controller and indoor unit are correct.	388
Operation sometimes stops.	Check the power supply.	A power failure of 2 to 10 cycles stops air conditioner operation. (Operation lamp OFF)	
	Check the outdoor temperature.	Heating operation cannot be used when the outdoor temperature is 24°C (75.2°F) or higher, and cooling operation cannot be used when the outdoor temperature is below 10°C (50°F).	_
	Diagnose with remote controller indication.	_	94
The unit operates but does not cool, or does not heat.	Check for wiring and piping errors in the connection between the indoor unit and outdoor unit.	—	_
	Check for thermistor detection errors.	Check if the thermistor is mounted securely.	—
	Check for faulty operation of the electronic expansion valve.	Set the unit to cooling operation, and check the temperature of the liquid pipe to see if the electronic expansion valve works.	_
	Diagnose with remote controller indication.	—	94
	Diagnose by service port pressure and operating current.	Check for refrigerant shortage.	104
operating noise and vibrations	Check the output voltage of the power module.	_	153
	Check the power module.	_	_
	Check the installation condition.	Check if the required spaces for installation (specified in the installation manual) are provided.	_

3. Service Check Function

Check Method 1

1. When the timer cancel button is held down for 5 seconds, **00** is displayed on the temperature display screen.

(R14460)

2. Press the timer cancel button repeatedly until a long beep sounds.

■ The code indication changes in the sequence shown below.

No.	Code	No.	Code	No.	Code
1	00	13	C7	25	UA
2	U4	14	A3	26	UH
3	L5	15	H8	27	P4
4	E6	16	H9	28	L3
5	H6	17	C9	29	L4
6	НО	18	C4	30	H7
7	A6	19	C5	31	U2
8	E7	20	J3	32	EA
9	UO	21	J6	33	AH
10	F3	22	E5	34	FA
11	A5	23	A1	35	H1
12	F6	24	E1	36	P9

1. A short beep or two consecutive beeps indicate non-corresponding codes.

- 2. To return to the normal mode, hold the timer cancel button down for 5 seconds. When the remote controller is left untouched for 60 seconds, it also returns to the normal mode.
- Not all the error codes are displayed. When you cannot find the error code, try the check method 2. (→ Refer to page 92.)

Check Method 2 1. Press the 3 buttons (TEMP▲, TEMP▼, MODE) at the same time to enter the diagnosis mode.

The left-side number blinks.

2. Press the [TEMP] ▲ or ▼ button and change the number until you hear the two consecutive beeps or the long beep.

3. Diagnose by the sound.

★beep : The left-side number does not correspond with the error code.
 ★two consecutive beeps : The left-side number corresponds with the error code but the right-side number does not.

- ★long beep : Both the left-side and right-side number correspond with the error code. The numbers indicated when you hear the long beep are the error code. \rightarrow Refer to page 94.
- 4. Press the [MODE] button.

The right-side number blinks.

5. Press the [TEMP] \blacktriangle or \triangledown button and change the number until you hear the long beep.

6. Diagnose by the sound.

★beep : The left-side number does not correspond with the error code.
 ★two consecutive beeps : The left-side number corresponds with the error code but the right-side number does not.

★long beep : Both the left-side and right-side number corresponds with the error code.

- Determine the error code.
 The numbers indicated when you hear the long beep are the error code.
 Error codes and description → Refer to page 94.
- 8. Press the [MODE] button to exit from the diagnosis mode.

The display **7**⁻ means the trial operation mode. Refer to page 386 for trial operation.

9. Press the [ON/OFF] button twice to return to the normal mode.

(R14	4549)

Note: When the remote controller is left untouched for 60 seconds, it returns to the normal mode.

 \star : Displayed only when system-down occurs.

4.2 Indoor Unit PCB Abnormality

Remote Controller Display	A1	
Method of Malfunction Detection	The system checks if the circuit works properly within the microcomputer of the indoor unit.	
Malfunction Decision Conditions	The system cannot set the internal settings.	
Supposed Causes	 Wrong models interconnected Defective indoor unit PCB Disconnection of connector Reduction of power supply voltage 	

Troubleshooting

(R15270)

Note:	Check the following connector.

Model Type	Connector
FTXS series	Terminal board ~ Control PCB
FDXS series	Terminal board ~ Control PCB

4.3 Freeze-up Protection Control or Heating Peak-cut Control

Remote Controller Display	A5
Method of	Freeze-up protection control
Malfunction Detection	 During cooling operation, the freeze-up protection control (operation halt) is activated according to the temperature detected by the indoor heat exchanger thermistor. Heating peak-cut control
	During heating operation, the temperature detected by the indoor heat exchanger thermistor is used for the heating peak-cut control (operation halt, outdoor fan stop, etc.)
Malfunction	Freeze-up protection control
Decision	During cooling operation, the indoor heat exchanger temperature is below 0°C (32°F).
Conditions	Heating peak-cut control
	During heating operation, the indoor heat exchanger temperature is above $60 \sim 65^{\circ}$ C (140 \sim 149°F) (depending on the model).
Supposed	 Short-circuited air
Causes	Clogged air filter of the indoor unit
	Dust accumulation on the indoor heat exchanger
	Defective indoor heat exchanger thermistor
	Defective indoor unit PCB

(R15715)
4.4 Fan Motor or Related Abnormality4.4.1 DC Motor (FTXS Series)

Remote Controller Display	A6
Method of Malfunction Detection	The rotation speed detected by the Hall IC during fan motor operation is used to determine abnormal fan motor operation.
Malfunction Decision Conditions	The detected rotation speed does not reach the demanded rotation speed of the target tap, and is less than 50% of the maximum fan motor rotation speed.
Supposed	Layer short inside the fan motor winding
Causes	Breaking of wire inside the fan motor
	Breaking of the fan motor lead wires
	Defective capacitor of the fan motor
	Defective indoor unit PCB

4.4.2 AC Motor (FDXS Series)

Remote Controller Display	A6
Method of Malfunction Detection	The rotation speed detected by the Hall IC during fan motor operation is used to determine abnormal fan motor operation.
Malfunction Decision Conditions	The detected rotation speed does not reach the demanded rotation speed of the target tap, and is less than 50% of the maximum fan motor rotation speed.
Supposed Causes	 Reduction of power supply voltage Layer short inside the fan motor winding Breaking of wire inside the fan motor Breaking of the fan motor lead wires Defective capacitor of the fan motor Defective indoor unit PCB

4.5 Thermistor or Related Abnormality (Indoor Unit)

Remote Controller Display	C4 , C9
Method of Malfunction Detection	The temperatures detected by the thermistors determine thermistor errors.
Malfunction Decision Conditions	The thermistor input is more than 4.96 V or less than 0.04 V during compressor operation.
Supposed Causes	 Disconnection of connector Defective thermistor Defective indoor unit PCB
Troubleshooting Check No.01 Refer to P.142	Image: Caution Be sure to turn off the power switch before connecting or disconnecting connecting connectors, or parts may be damaged. Image: Check the connection of connectors. Image: Connector connection of connectors. Image: Version of connectors. Image: Connector connection connection connection connection. 	Refrigerant sho The following co • Opening of th	-	e for 80 secor		

 Discharge pipe temperature (°C) > H × target discharge pipe temperature (°C) + J (°C) (Discharge pipe temperature (°F) > H × target discharge pipe temperature (°F) + K (°F))

	G (pulse)	H (–)	J (°C)	K (°F)
09/12 class	480	128/128	cooling: 63.5, heating: 30	cooling: 114.3, heating: 54
15/18 class	480	128/128	cooling: 60, heating: 45	cooling: 108, heating: 81
24 class	450	128/128	60	108
30/36 class	480	128/128	cooling: 50, heating: 45	cooling: 90, heating: 81

Refrigerant shortage detection III: (09/12 class only)

When the difference of the temperature is smaller than L, it is regarded as refrigerant shortage.

		L
Cooling	room thermistor temperature - indoor heat exchanger temperature	4.0°C (7.2°F)
Cooling	outdoor heat exchanger temperature – outdoor temperature	4.0°C (7.2°F)
Heating	indoor heat exchanger temperature - room thermistor temperature	3.0°C (5.4°F)
	outdoor temperature – outdoor heat exchanger temperature	3.0°C (5.4°F)

■ If the error repeats, the system is shut down.

Reset condition: Continuous run for about 60 minutes without any other error

Supposed Causes

- Disconnection of the discharge pipe thermistor, indoor or outdoor heat exchanger thermistor, room or outdoor temperature thermistor
- Closed stop valve
- Refrigerant shortage (refrigerant leakage)
- Poor compression performance of compressor
- Defective electronic expansion valve

4.7 Low-voltage Detection or Over-voltage Detection

Remote Controller Display	U2
Method of Malfunction	★ Indoor Unit
Detection	The zero-cross detection of the power supply is evaluated by the indoor unit PCB.
	★ Outdoor Unit
	Low-voltage detection: An abnormal voltage drop is detected by the DC voltage detection circuit.
	Over-voltage detection: An abnormal voltage rise is detected by the over-voltage detection circuit.
Malfunction Decision	★ Indoor Unit
Conditions	There is no zero-cross detection in approximately 10 seconds.
	★ Outdoor Unit
	 Low-voltage detection: The voltage detected by the DC voltage detection circuit is below 150 ~ 200 V (depending on the model). The compressor stops if the error occurs, and restarts automatically after 3-minute standby.
	 Over-voltage detection: An over-voltage signal is fed from the over-voltage detection circuit to the microcomputer. The compressor stops if the error occurs, and restarts automatically after 3-minute standby.
Supposed Causes	 Supply voltage is not as specified. Defective DC voltage detection circuit Defective over-voltage detection circuit Defective PAM control part Disconnection of compressor harness Noise Momentary fall of voltage Momentary power failure Defective indoor unit PCB

Troubleshooting

(R16043)

4.8 Signal Transmission Error (between Indoor Unit and Outdoor Unit)

Remote Controller Display	U4
Method of Malfunction Detection	The data received from the outdoor unit in indoor unit-outdoor unit signal transmission is checked whether it is normal.
Malfunction Decision Conditions	The data sent from the outdoor unit cannot be received normally, or the content of the data is abnormal.
Supposed Causes	 Wiring error Breaking of the connection wires between the indoor and outdoor units (wire No. 3) Defective outdoor unit PCB Defective indoor unit PCB Disturbed power supply waveform

4.9 Signal Transmission Error on Outdoor Unit PCB (24/30/36 Class Only)

Remote Controller Display	U7	_
Method of Malfunction Detection	Communication error between microcomputer mounted on the main microcomputer and PM1.	_
Malfunction Decision Conditions	 The abnormality is determined when the data sent from the PM1 can not be received for 9 seconds. The error counter is reset when the data from the PM1 can be successfully received. 	-
Supposed Causes	Defective outdoor unit PCB	_

4.12 OL Activation (Compressor Overload)

Remote Controller Display	E5	
Method of Malfunction Detection	A compressor overload is detected through compressor OL.	
Malfunction Decision Conditions	 If the error repeats, the system is shut down. Reset condition: Continuous run for about 60 minutes without a * The operating temperature condition is not specified. 	any other error
Supposed Causes	 Defective discharge pipe thermistor Defective electronic expansion valve or coil Defective FourWay valve or coil Defective outdoor unit PCB Refrigerant shortage Water mixed in refrigerant Defective stop valve 	
Troubleshooting	Caution Be sure to turn off the power switch before connection connectors, or parts may be damaged.	ng or disconnecting
Check No.01 Refer to P.142	Discharge pipe YES thermistor disconnected?	Insert the thermistor in position.
Check No.12 Refer to P.144	NO Check No. 01 Check the thermistors. * Discharge pipe thermistor	Replace the discharge pipe thermistor.
Check No.13 Refer to P.145	OK Check No. 12 Check the electronic expansion valve. NG	Replace the electronic expansion valve or the coil.
Refer to P.145	OK Check No. 13 Check the four-way valve. OK	Replace the four-way valve or the coil. Replace the outdoor unit PCB.
	Check No. 14 Check the refrigerant line. * Refrigerant shortage * Water mixed * Stop valve	Refer to the refrigerant line check procedure.
	OK	 Replace the outdoor unit PCB. (R14438)

4.13 Compressor Lock

Remote Controller Display	E6			
Method of Malfunction Detection	A compressor lock is detected by checking the compressor running condition through the position detection circuit.			
Malfunction Decision Conditions	 09/12 class Operation stops due to overcurrent. If the error repeats, the system is shut down. Reset condition: Continuous run for about 11 minutes without any other error 15/18/24/30/36 class A compressor lock is detected by the current waveform generated when applying high- 			
	 frequency voltage to the motor. If the error repeats, the system is shut down Reset condition: Continuous run for about 5 minutes without any or 	ther error		
Supposed Causes	 Compressor locked Compressor harness disconnected 			
Troubleshooting Check No.15 Refer to P.146	Caution Be sure to turn off the power switch before connecting or connectors, or parts may be damaged. (Precaution before turning on the power again) Make sure the power has been off for at least 30 seconds. Turn off the power. Disconnect the harnesses U, V, and W. Image: Check No.15 Check with the inverter checker (*).	disconnecting		
	Normal? VES Turn off the power and reconnect the harnesses. Turn on the power again and restart the system. Emergency YES	 Correct the power supply or replace the outdoor unit PCB. 		
	stop without compressor running? NO System shut down after errors repeated several times? YES	 Replace the compressor. Check the outdoor electronic expansion valve coil. Replace it as required. Replace the compressor. (R14439) 		

4.14 DC Fan Lock

Remote Controller Display	E7				
Method of Malfunction Detection	An error is determined with the high-voltage fan motor rotation speed detected by the Hall IC.				
Malfunction Decision Conditions	 The fan does not start in 15 ~ 30 seconds (depending on the model) even when the fan motor is running. If the error repeats, the system is shut down. Reset condition: Continuous run for about 11 minutes (09/12 class) or 5 minutes (15/18/24/30/ 36 class) without any other error 				
Supposed Causes	 Foreign matter stuck in the fan Defective fan motor Defective outdoor unit PCB 				
Troubleshooting	Caution Be sure to turn off the power switch before connectine connectors, or parts may be damaged.	ng or disconnecting			
Check No.16 Refer to P.148	Fan motor connector YES disconnected?	Turn off the power and reconnect the connector.			
	Foreign matters in or around the fan?	Remove the foreign matters.			
	Turn on the power.				
	Fan rotates smoothly?	→ Replace the outdoor fan motor.			
	Check No. 16 Check the rotation pulse input on the outdoor unit PCB.				
	Pulse signal generated? NO	Replace the outdoor fan motor.			
	YES	→ Replace the outdoor unit PCB. (R15675)			

4.15 Input Overcurrent Detection

Remote Controller Display	E8				
Method of Malfunction Detection	An input overcurrent is detected by checking the input current value with the compressor running.				
Malfunction Decision Conditions	The current exceeds about 9.25 ~ 20 A for 2.5 seconds with the compressor running. (The upper limit of the current decreases when the outdoor temperature exceeds a certain level.)				
Supposed Causes	 Outdoor temperature is out of operation range. Defective compressor Defective power module Defective outdoor unit PCB Short circuit 				
Troubleshooting Check No.15 Refer to P.146	Be sure to turn off the power switch before connecting or disconnecting connectors, or parts may be damaged. An input overcurrent may result from wrong internal wiring. If the system is interrupted by an input overcurrent after the wires have been disconnected and reconnected for part replacement, check the wiring again.				
Check No.17 Refer to P.149	Check No. 17 Check the installation condition.				
Check No.18 Refer to P.150	Input current flowing above its stop level? NO YES PCB. Turn off the power and disconnect the harnesses U, V, and W. * Inverter checker Check No.15 * Inverter checker Check with the inverter checker (*). * Inverter checker				
	Any LED off? NO Turn off the power, and reconnect the harnesses. Turn on the power again and start operation. Check No. 18 Check the discharge pressure. (R14440)				

4.16 FourWay Valve Abnormality

Remote Controller Display	EA
Method of Malfunction Detection	The room temperature thermistor and the indoor heat exchanger thermistor are checked if they function within their normal ranges in each operation mode.
Malfunction Decision Conditions	 A following condition continues over 1 ~ 10 minutes after operating for 5 ~ 10 minutes. Cooling / Dry (room thermistor temp. – indoor heat exchanger temp.) < -5°C (-9°F) Heating (indoor heat exchanger temp. – room thermistor temp.) < -5°C (-9°F) If the error repeats, the system is shut down. Reset condition: Continuous run for about 60 minutes without any other error
Supposed Causes	 Disconnection of fourway valve coil Defective fourway valve, coil, or harness Defective outdoor unit PCB Defective thermistor Refrigerant shortage Water mixed in refrigerant Defective stop valve

4.17 Discharge Pipe Temperature Control

Remote Controller Display	F3					
Method of Malfunction Detection	An error is determined with the temperature detected by the discharge pipe thermistor.					
Malfunction Decision Conditions	 If the temperature detected by the discharge pipe thermistor rises above A, the compressor stops. The error is cleared when the discharge pipe temperature has dropped below B. <09/12 class> 					
				Α	В	
	(1) above 45 Hz (risi	ng), above 40 Hz	(dropping)	110°C (230°F)	97°C (206.6°F)

4.18 High Pressure Control in Cooling

Remote Controller Display	F6
Method of Malfunction Detection	High-pressure control (operation halt, frequency drop, etc.) is activated in cooling operation if the temperature sensed by the outdoor heat exchanger thermistor exceeds the limit.
Malfunction Decision Conditions	 The temperature sensed by the outdoor heat exchanger thermistor rises above about 60 ~ 65°C (140 ~ 149°F). The error is cleared when the temperature drops below about 50°C (122°F).
Supposed Causes	 The installation space is not large enough. Dirty outdoor heat exchanger Defective outdoor fan motor Defective stop valve Defective electronic expansion valve or coil Defective outdoor heat exchanger thermistor

Defective outdoor unit PCB

SiUS091133

4.19 Compressor System Sensor Abnormality 4.19.1 09/12/15/18 Class

Remote Controller Display	HO				
Method of Malfunction Detection	The system checks the DC current before the compressor starts.				
Decision	 The DC current before compressor start-up is out of the range 0.5 ~ 4.5 V (sensor output converted to voltage value) The DC voltage before compressor start-up is below 50 V. 				
Supposed Causes	 Broken or disconnected harness Defective outdoor unit PCB 				
Troubleshooting	Image: Note that the power and turn it on again? Note problem. Keep on running. Image: Note that the power and turn it on again? Note problem. Keep on running. Image: Note that the power and turn it on again? Note problem. Keep on running. Image: Note that the power of				

4.19.2 24/30/36 Class

HO

Remote Controller Display

Method of Malfunction Detection

Malfunction Decision Conditions The system checks the compressor current right after the compressor starts.

The system checks the supply voltage and the DC voltage before the compressor starts.

The supply voltage and the DC voltage is obviously low or high.
 The compressor current does not run when the compressor starts.

Supposed Causes

- Disconnection of reactor
- Disconnection of compressor harness
- Defective outdoor unit PCB
- Defective compressor

Troubleshooting

(R15891)

4.20 Position Sensor Abnormality

Remote Controller Display	H6
Method of Malfunction Detection	A compressor start-up failure is detected by checking the compressor running condition through the position detection circuit.
Malfunction Decision Conditions	 If the error repeats, the system is shut down. Reset condition: Continuous run for about 11 minutes (09/12 class) or 5 minutes (15/18/24/30/ 36 class) without any other error
Supposed Causes	 Disconnection of the compressor relay cable Defective compressor Defective outdoor unit PCB Start-up failure caused by the closed stop valve Input voltage is outside the specified range.

4.21 DC Voltage / Current Sensor Abnormality (09/12 Class Only)

Remote Controller Display	H8
Method of Malfunction Detection	DC voltage or DC current sensor abnormality is identified based on the compressor running frequency and the input current.
Malfunction Decision Conditions	 If the error repeats, the system is shut down. Reset condition: Continuous run for about 60 minutes without any other error
Supposed Causes	Defective outdoor unit PCB
Troubleshooting	
	Caution Be sure to turn off the power switch before connecting or disconnecting connectors, or parts may be damaged.

Replace the outdoor unit PCB.

4.22 CT or Related Abnormality (24/30/36 Class Only)

Remote Controller Display	H8			
Method of Malfunction Detection	A CT or relate input current.		etected by checking the compressor running frequency and CT-detected

Conditions

Decision

4.25 Radiation Fin Temperature Rise

Remote Controller Display	L4
Method of	A rac
Malfunction	comp

A radiation fin temperature rise is detected by checking the radiation fin thermistor with the compressor on.

- If the radiation fin temperature with the compressor on is above **A**.
- The error is cleared when the radiation fin temperature drops below **B**.
- If the error repeats, the system is shut down.
- Reset condition: Continuous run for about 60 minutes without any other error

	Α	В
09/12 class	98°C (208.4°F)	78°C (172.4°F)
15/18 class	85°C (185°F)	56°C (132.8°F)
24/30/36 class	105°C (221°F)	97°C (206.6°F)

Supposed Causes

- Defective outdoor fan motor
- Short circuit
- Defective radiation fin thermistor
- Disconnection of connector
- Defective outdoor unit PCB
- Silicon grease is not applied properly on the radiation fin after replacing the outdoor unit PCB.

Troubleshooting

	Α
09/12 class	98°C (208.4°F)
15/18 class	85°C (185°F)
24/30/36 class	105°C (221°F)

Refer to "Application of silicon grease to a power transistor and a diode bridge" on page 391 for detail.

4.26 Output Overcurrent Detection

Remote Controller Display	L5
Method of Malfunction Detection	An output overcurrent is detected by checking the current that flows in the inverter DC section.
Malfunction Decision Conditions	 A position signal error occurs while the compressor is running. A speed error occurs while the compressor is running. An output overcurrent signal is fed from the output overcurrent detection circuit to the microcomputer. If the error repeats, the system is shut down. Reset condition: Continuous run for about 11 minutes (09/12 class) or 5 minutes (15/18/24/30/ 36) without any other error
Supposed Causes	 Poor installation condition Closed stop valve Defective power module Wrong internal wiring Abnormal power supply voltage Defective outdoor unit PCB Defective compressor

5. Check5.1 Thermistor Resistance Check

Check No.01

Disconnect the connectors of the thermistors from the PCB, and measure the resistance of each thermistor using tester.

The relationship between normal temperature and resistance is shown in the table and the graph below.

Temperature (°C / °F)	Resistance ($k\Omega$)
-20 / -4	197.8
–15 / 5	148.2
-10 / 14	112.1
-5 / 23	85.60
0 / 32	65.93
5 / 41	51.14
10 / 50	39.99
15 / 59	31.52
20 / 68	25.02
25 / 77	20.00
30 / 86	16.10
35 / 95	13.04
40 / 104	10.62
45 / 113	8.707
50 / 122	7.176

The data is for reference purpose only

(R25°C (77°F) = 20 kΩ, B = 3950 K)

- The room temperature thermistor is directly mounted on the display PCB. Remove the display PCB from the control PCB to measure the resistance.
- When the indoor heat exchanger thermistor is soldered on the PCB, remove the thermistor and measure the resistance.

5.2 **Fan Motor Connector Output Check**

Check No.02

FTXS series

- 1. Check the connection of connector.
- 2. Check the motor power supply voltage output (pins 4 7).
- 3. Check the motor control voltage (pins 4 3).
- 4. Check the rotation command voltage (pins 4 2).
- 5. Check the rotation pulse (pins 4 1).

Hall IC Check 5.3

Check No.04

FDXS series

- 1. Check the connector connection.
- 2. With the power on, operation off, and the connector connected, check the following. *Output voltage of about 5 V between pins 1 and 3. *Generation of 3 pulses between pins 2 and 3 when the fan motor is operating.

If NG in step 1 \rightarrow Defective PCB \rightarrow Replace the PCB. If NG in step 2 \rightarrow Defective Hall IC \rightarrow Replace the fan motor.

If OK in both steps 1 and 2

→ Replace the PCB.

5.4 Power Supply Waveforms Check

Check No.11

Measure the power supply waveform between No. 1 and No. 2 on the terminal board, and check the waveform disturbance.

- Check to see if the power supply waveform is a sine wave. (Fig.1)
- Check to see if there is waveform disturbance near the zero cross. (sections circled in Fig.2)

5.5 Electronic Expansion Valve Check

Check No.12

Conduct the followings to check the electronic expansion valve (EV).

- 1. Check to see if the EV connector is correctly connected to the PCB.
- 2. Turn the power off and on again, and check to see if the EV generates a latching sound.
- 3. If the EV does not generate a latching sound in the above step 2, disconnect the connector and check the continuity using a tester.
- 4. Check the continuity between the pins 1 6, 2 6, 3 6, and 4 6. If there is no continuity between the pins, the EV coil is faulty.

5. If the continuity is confirmed in step 3, the outdoor unit PCB is faulty.

e: Please note that the latching sound varies depending on the valve type.

5.6 FourWay Valve Performance Check

Check No.13

5.7 Inverter Units Refrigerant System Check

Check No.14

5.8 "Inverter Checker" Check

Check No.15

Characteristics

If an abnormal stop occurs due to compressor startup failure or overcurrent output when using an inverter unit, it is difficult to judge whether the stop is caused by the compressor failure or some other failure (control PCB, power module, etc.). The inverter checker makes it possible to judge the cause of trouble easily and securely. (Connect this checker as a quasi-compressor instead of compressor and check the output of the inverter)

Operation Method

Step 1

Be sure to turn the power off.

Step 2

Install the inverter checker instead of a compressor.

Note:

Make sure the charged voltage of the built-in smoothing electrolytic capacitor drops to 10 VDC or below before carrying out the service work.

Reference:

If the terminals of the compressor are not FASTON terminals (difficult to remove the wire on the terminals), it is possible to connect wires available on site to the outdoor unit from output side of PCB. (Do not connect them to the compressor at the same time, otherwise it may result in incorrect detection.)

Step 3

Activate the power transistor test operation from the outdoor unit.

- 1) Press the forced cooling operation [ON/OFF] button for 5 seconds.
- (Refer to page 384 for the position.)
- \rightarrow Power transistor test operation starts.

Diagnose method (Diagnose according to 6 LEDs lighting status.)

- (1) If all the LEDs are lit uniformly, the compressor is defective. \rightarrow Replace the compressor.
- (2) If the LEDs are not lit uniformly, check the power module. \rightarrow Refer to **Check No.22**.
- (3) If NG in Check No.22, replace the power module.(Replace the main PCB. The power module is united with the main PCB.)If OK in Check No.22, check if there is any solder cracking on the PCB.
- (4) If any solder cracking is found, replace the PCB or repair the soldered section. If there is no solder cracking, replace the PCB.

Caution

- (1) When the output frequency is low, the LEDs blink slowly. As the output frequency increases, the LEDs blink quicker. (The LEDs look like they are lit.)
- (2) On completion of the inverter checker diagnosis, be sure to re-crimp the FASTON terminals. Otherwise, the terminals may be burned due to loosening.

5.9 Rotation Pulse Check on the Outdoor Unit PCB

Check No.16

09/12 class

- 1. Check that the voltage between the pins 10 11 is 15 VDC.
- 2. Check if the Hall IC generates the rotation pulse (0 ~ 15 VDC) 4 times between the pins 10 -12,
 - 10 13, when the fan motor is manually rotated once.

15/18/24/30/36 class

Make sure that the voltage of 320 ± 30 V is applied.

- 1. Set operation off and power off. Disconnect the connector S70.
- 2. Check that the voltage between the pins 4 7 is 320 VDC.
- 3. Check that the control voltage between the pins 3 4 is 15 VDC.
- 4. Check that the rotation command voltage between the pins 2 4 is 0 ~ 15 VDC.
- 5. Keep operation off and power off. Connect the connector S70.
- Check whether 2 pulses (0 ~ 15 VDC) are output at the pins 1 4 when the fan motor is rotated 1 turn by hand.

When the fuse is melted, check the outdoor fan motor for proper function.

5.10 Installation Condition Check

Check No.17

5.11 Discharge Pressure Check

Check No.18

5.12 Outdoor Fan System Check

5.13 Main Circuit Short Check

Check No.20

Check to make sure that the voltage between (+) and (–) of the diode bridge (DB1) is approx. 0 V before checking.

- Measure the resistance between the pins of the DB1 referring to the table below.
- If the resistance is ∞ or less than 1 k Ω , short circuit occurs on the main circuit.

Negative (–) terminal of tester (positive terminal (+) for digital tester)	~ (2, 3)	+ (4)	~ (2, 3)	- (1)
Positive (+) terminal of tester (negative terminal (–) for digital tester)	+ (4)	~ (2, 3)	— (1)	~ (2, 3)
Resistance is OK.	several k Ω ~ several M Ω	œ	œ	several k Ω ~ several M Ω
Resistance is NG.	0 Ω or ∞	0	0	0 Ω or ∞

09/12 class

15/18 class

5.14 Capacitor Voltage Check

Check No.21

Before this check, be sure to check the main circuit for short circuit. With the circuit breaker still on, measure the voltage according to the drawing of the model in question. Be careful never to touch any live parts.

5.15 Power Module Check

Check No.22

Check to make sure that the voltage between (+) and (–) of the power module is approx. 0 V before checking.

- Disconnect the compressor harness connector from the outdoor unit PCB. To disengage the connector, press the protrusion on the connector.
- Follow the procedure below to measure resistance between the terminals of the power module and the terminals of the compressor with a multi-tester. Evaluate the measurement results referring to the following table.

Negative (–) terminal of tester (positive terminal (+) for digital tester)	Power module (+)	UVW	Power module (–)	UVW	
Positive (+) terminal of tester (negative terminal (–) for digital tester)	UVW	Power module (+)	UVW	Power module (–)	
Resistance is OK.	several k Ω ~ several M Ω				
Resistance is NG.	esistance is NG. $0 \Omega \text{ or } \infty$

5.	Appli	cation of Silicon Grease to a Power Transistor and	
	a Dic	de Bridge	

1. Pump Down Operation

Outline

In order to protect the environment, be sure to conduct pump down operation when relocating or disposing the unit.

Detail

- 1) Remove the valve caps from the liquid stop valve and the gas stop valve.
- 2) Carry out forced cooling operation.
- 3) After 5 to 10 minutes, close the liquid stop valve with a hexagonal wrench.
- 4) After 2 to 3 minutes, close the gas stop valve and stop the forced cooling operation.

09/12/15/18 class

Refer to page 384 for forced cooling operation.

2. Forced Cooling Operation

Item	Forced Cooling
Conditions	The forced cooling operation is allowed when both of the following conditions are met.
	 The outdoor unit is not abnormal and not in the 3-minute standby mode. The outdoor unit is not operating.
Start	The forced cooling operation starts when any of the following conditions is fulfilled.
	1) Press the forced cooling operation [ON/OFF] button (SW1) on the indoor unit for 5 seconds.
	2) Press the forced cooling operation [ON/OFF] button (SW1) on the outdoor unit.
Command frequency	09/12 class: 58 Hz 15/18 class: 66 Hz 24 class: 31 Hz 30/36 class: 55 Hz
End	 The forced cooling operation ends when any of the following conditions is fulfilled. 1) The operation ends automatically after 15 minutes. 2) Press the forced cooling operation [ON/OFF] button (SW1) on the indoor unit again. 3) Press the [ON/OFF] button on the remote controller. 4) Press the forced cooling operation [ON/OFF] button (SW1) on the outdoor unit.
Others	Protection functions have priority over all other functions during forced cooling operation.

Indoor Unit

FTXS series

FDXS series

(R16615)

Outdoor Unit

09/12 class

15/18 class

^{24/30/36} class

3. Trial Operation

Outline

1. Measure the supply voltage and make sure that it falls within the specified range.

- 2. Trial operation should be carried out in either cooling or heating operation.
- 3. Carry out the trial operation in accordance with the operation manual to ensure that all functions and parts, such as louver movement, are working properly.
- The air conditioner requires a small amount of power in standby mode. If the system is not to be used for some time after installation, shut off the circuit breaker to eliminate unnecessary power consumption.
- If the circuit breaker trips to shut off the power to the air conditioner, the system backs up the operation mode. The system then restarts operation with the previous operation mode when the circuit breaker is restored.

In cooling operation, select the lowest programmable temperature; in heating operation, select the highest programmable temperature.

- Trial operation may be disabled in either operation mode depending on the room temperature.
- After trial operation is complete, set the temperature to a normal level. (26 ~ 28°C (78.8 ~ 82.4°F) in cooling, 20 ~ 24°C (68 ~ 75.2°F) in heating)
- For protection, the system does not start for 3 minutes after it is turned off.

Detail ARC452 Series

- (1) Press the [ON/OFF] button to turn on the system.
- (2) Press the both of [TEMP] buttons and the [MODE] button at the same time.
- (3) Press the [MODE] button twice.
 - (**T** appears on the display to indicate that trial operation is selected.)
- (4) Press the [MODE] button and select the operation mode.
- (5) Trial operation terminates in approx. 30 minutes and switches into normal mode. To quit trial operation, press the [ON/OFF] button.

4. Field Settings

4.1 Model Type Setting

- This remote controller is common to the heat pump model and cooling only model. Use the DIP switch on the remote controller to set the heat pump model or cooling only model.
- Make the setting as shown in the illustration. (The factory set is the heat pump side.)
 - Heat pump model: Set the DIP switch to H/P.
 - Cooling only model: Set the DIP switch to C/O.

4.2 Temperature Display Switch

- You can select Fahrenheit or Celsius for temperature display.
- Press the TEMP▲ and ▼ buttons simultaneously for 5 seconds to change the unit of temperature display.

4.3 When 2 Units are Installed in 1 Room

Outline

When 2 indoor units are installed in 1 room, 1 of the 2 indoor units and the corresponding wireless remote controller can be set for different addresses. Both the indoor unit PCB and the wireless remote controller need alteration.

Both the indoor whit FCB and the wheless remote controller heed

Indoor Unit PCB

■ Cut the address setting jumper JA on the control PCB.

FTXS15/18/24/30/36LVJU

FDXS series

■ Cut the address setting jumper.

Wireless Remote Controller

ADDRESS EXIST 1 CUT 2 (R13525)

4.4 Facility Setting Jumper and Switch (Cooling at Low Outdoor Temperature)

Outline

This function is limited only for facilities (the target of air conditioning is equipment such as computer. Never use it in spaces occupied by humans such as a residence or office.

Detail

You can expand the operation range to -10° C (14° F) by cutting the jumper or turning on switch on the outdoor unit PCB. If the outdoor temperature falls to -18° C (-0.4° F) or lower, the operation stops. If the outdoor temperature rises, the operation starts again.

09/12 class

24/30/36 class

(R14478)

- 1. If the outdoor unit is installed where the outdoor heat exchanger of the unit is exposed to direct wind, provide a windbreak wall.
- 2. Intermittent noises may be produced by the indoor unit due to the outdoor fan turning on and off when using facility settings.
- 3. Do not place humidifiers or other items which might raise the humidity in rooms where facility settings are being used.

A humidifier might cause dew jumping from the indoor unit outlet vent.

- 4. Cutting the jumper sets the indoor fan tap to the highest position. (09/12/15/18 class)
- 5. Use the indoor unit at the highest level of airflow rate. (24/30/36 class)

4.5 Jumper Settings

Jumper	Function	When connected (factory set)	When cut
JB (on indoor unit PCB)	Fan speed setting when compressor stops for thermostat OFF. (effective only at cooling operation)	Fan speed setting; Remote controller setting	Fan rpm is set to "0" <fan stop></fan
JC (on indoor unit PCB)	Power failure recovery function	Auto-restart	The unit does not resume operation after recovering from a power failure. Timer ON/OFF settings are cleared.

For the location of the jumper, refer to the following pages. Indoor unit; page 14, 17, 20

5. Application of Silicon Grease to a Power Transistor and a Diode Bridge

Applicable Models	All outdoor units using an inverter type compressor for room air conditioner.				
	When the printed circuit board (PCB) of an outdoor unit is replaced, it is required that silicon grease (*1) be precisely applied to the heat radiation part (the contact point to the radiation fin) of the power transistor and the diode bridge. *1: Parts number of the silicon grease – 1172698 (Drawing number 3FB03758-1)				
Details	The silicon grease is essential for proper heat radiation of the power transistor and the diode bridge. Applying the grease should be implemented in accordance with the following instruction. Note: There is a possibility of failure and smoke emission in case of poor heat radiation.				
	 Wipe off the old silicon grease completely off the radiation fin. Apply silicon grease evenly to the whole surface of the radiation fin. Do not leave any foreign object such as solder or paper waste between the power transistor and the radiation fin, or the diode bridge and the radiation fin. 				
	 Tighten the screws of the power transistor and the diode bridge, and contact to the radiation fin without any gap. <example></example> 				
	The shape of the electrical box and PCB vary depending on the model.				
	Take out a PCB				
	Not applied. Paper waste				
	OK : Evenly applied NG : Not evenly NG : Foreign object				

silicon grease.

applied

Warning

Daikin Industries, Ltd.'s products are manufactured for export to numerous countries throughout the world. Daikin Industries, Ltd. does not have control over which products are exported to and used in a particular country. Prior to purchase, please therefore confirm with your local authorized importer, distributor and/or retailer whether this product conforms to the applicable standards, and is suitable for use, in the region where the product will be used. This statement does not purport to exclude, restrict or modify the application of any local legislation.

Ask a qualified installer or contractor to install this product. Do not try to install the product yourself. Improper installation can result in water or refrigerant leakage, electrical shock, fire, or explosion.

Use only those parts and accessories supplied or specified by Daikin. Ask a qualified installer or contractor to install those parts and accessories. Use of unauthorized parts and accessories or improper installation of parts and accessories can result in water or refrigerant leakage, electrical shock, fire, or explosion.

Read the User's Manual carefully before using this product. The User's Manual provides important safety instructions and warnings. Be sure to follow these instructions and warnings.

If you have any inquiries, please contact your local importer, distributor, or retailer.

CAUTIONS ON PRODUCT CORROSION:

1. Air conditioners should not be installed in areas where corrosive gases, such as acid gas or alkaline gas, are produced.

- 2. If the outdoor unit is to be installed close to the seashore, direct exposure to the sea breeze should be avoided. If you need to install the outdoor unit close to the seashore, contact your local distributor.
